

# User Story 2 — Library Navigation & Export

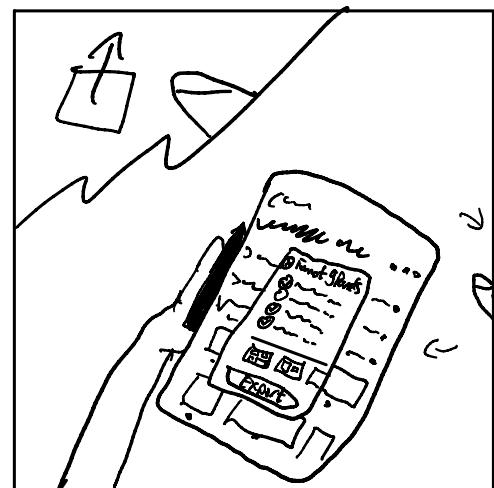

Yves' readers on Tapas, Tumblr, and Instagram are eagerly awaiting the weekly update.

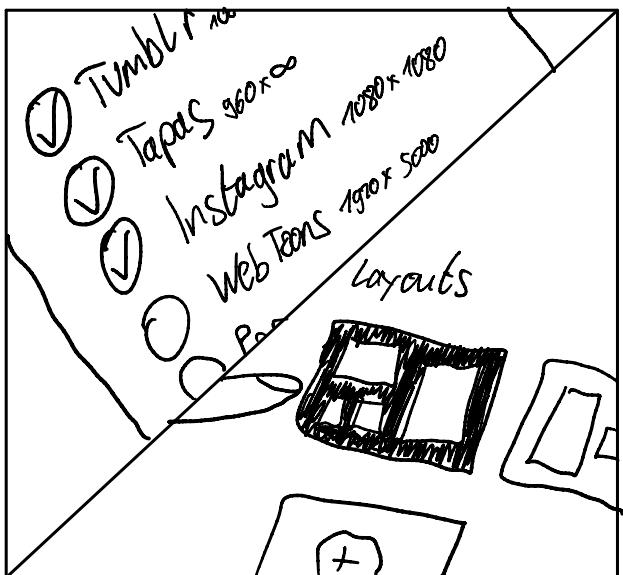

Having drawn all panels in advance, Yves sets out to publish the 9 most recent ones. Yves grabs their tablet computer and opens our application. Yves is presented a grid of all their works and taps on "Imploding Kittens" to reveal its contents.

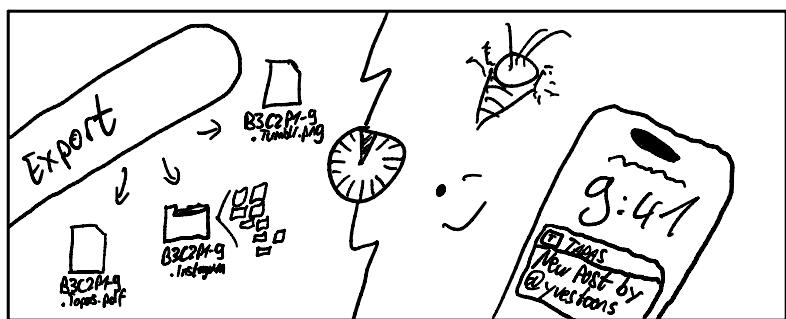

This view organizes all books and chapters in a structured tree. Conveniently, the most recent book is expanded by default and the view has scrolled down to the latest chapter. Yves selects the 9 panels they wish to release today.

Yves presses the export button and a modal sheet appears.

The platforms they always publish on are already selected, so no need to adjust anything there. Yves does customize the page layout, though, by choosing one of their presets.

Yves presses the prominent export button and selects a destination directory in the system's file provider. Image files appear for every platform, correctly sized and in the correct file format. One share sheet later and all of Yves' readers can finally learn how the story unrolls. On all platforms. Without manual repaneling.

The End
